

COZY NOOK

Simple Game Design Document

Build a Playable Prototype (Core Loop + D1)

1. Game Idea

PITCH - What is it?

Cozy Nook is a cozy 3D world-building game where players create and personalize miniature spaces one room at a time. At the start, the player sees 5 different worlds. The Cozy Home world is unlocked, while the other four worlds are locked. When the player opens Cozy Home, they enter a diary that contains all of its rooms, such as:

- Bedroom
- Bathroom
- Kitchen
- Living Room
- Balcony
- Garden

The player selects a room and enters an isometric 3D building view. They clean the space, place and align cute furniture and objects, solve a simple spatial challenge, and decorate the room in their own style.

Who is it for?

Cozy Nook is a cozy 3D world-building game for players 13+ and adults who enjoy cozy, soft, relaxing games. Players build cute miniature rooms, decorate them in their own style, and enjoy a peaceful experience in their free time.

2. Core Loop & First Session

Players choose the **Cozy Home** world, open its diary, and select a room like the **Bedroom**. They clean, build, arrange, and decorate the room in an isometric view. Completing a room unlocks the next one. Players return to discover and build the next room.

3. Progression & Metagame

There are **5 worlds**, with Cozy Home unlocked first. Each world contains multiple rooms inside its diary. Completing rooms unlocks more rooms, furniture, decorations, and eventually new worlds. **Day-1 Hook:** Players want to complete and personalize the entire world in their own style, turning it into a little world that feels truly theirs. The player sees the next rooms as locked pages in the book. After completing one room, the next page opens. The player wants to continue because they want to see and complete the whole Cozy Home

4. Money

I would make money through **optional customization**, such as:

- Furniture & decoration packs
- Seasonal themes
- New worlds
- Bunny character outfits and accessories
- Hats, bags, bows, clothes, and other cute items

The core gameplay would remain free, so players pay only if they want to make **their character and world more personal**.

5. AI

I used AI to help **prototype the HTML/JavaScript** and organize the **GDD/Word document**. AI is **not part of the game itself**. The game concept, gameplay loop, and design decisions are mine.

6. Shipping

First, I would test whether players enjoy **cleaning, placing, arranging, and completing a room**.

I would change the game if players don't understand the room puzzle, don't enjoy decorating, or don't want to complete the next room.

At soft launch, I would mainly watch:

- **First-room completion rate**
- **Day-1 retention**

7. Reference Games

Recently, I have the hobby of doing the DIY 3D Scene Sticker Book and also enjoyed it a lot. So, I looked at cozy room-decorating and miniature 3D games for their **isometric style, cute objects, and customization**.

I borrowed the feeling of creating small miniature scenes, but **Cozy Nook adds a spatial puzzle and a larger world/diary progression**, where players build and complete their own world.

Gameplay Insights & Strategy

In My opinion, I think **mobile farming and cooking games are overdue for reinvention.**

Most of these games follow the same loop:

Collect → Cook/Produce → Sell → Upgrade → Unlock → Repeat

The problem is that even when the story, characters, or graphics are different, the gameplay feels almost the same. When one game becomes successful, other studios often follow the same formula. For example, games like **Township** have a farming + production + building progression, and many similar games use a very familiar structure.

I think the genre needs to give players **more meaningful choices** instead of only asking them to complete the next task.

For example, in a cooking game, players could:

- Create and change their own recipes.
- Decide what food to sell.
- Discover what different customers like.
- Create a signature dish for their restaurant.
- Make choices that change the customers, shop, or story.

The goal would be to make every player's progression feel different.

The breakout game would not just have a new art style or story. It would change the way the player plays the genre.

Instead of simply collecting ingredients and following fixed recipes, players could experiment with ingredients, create their own recipes, and learn what different customers like. Their decisions would affect which customers visit, what becomes popular, and how their restaurant develops.

What could make it a breakout hit?

The goal would be to make every player's farm and restaurant develop differently. Instead of:

“What task should I complete next?” the player thinks:

“What should I grow, what should I cook, and what kind of business do I want to build?”

That would make the farming and cooking loop feel more personal, strategic, and less repetitive.

Design Specification

Magnetic Attack

1. Why I chose this feature

I chose **Magnetic Attack** for a **Survivor.io**-style mobile survivor game because the player normally focus on moving while attacks happen automatically. I wanted to add a simple mechanic that gives the player more **timing and strategy** without adding complicated controls. **The Magnetic Attack changes the player's behavior from “avoid the enemies” to “go toward the enemies and destroy them.”**

This creates a satisfying **risk vs. reward** moment: the player gets close to a large group to eliminate more enemies at once.

The Magnetic Attack creates a field that **pulls nearby enemies together and burns them.**

2.How the feature works

- The player unlocks **Magnetic Attack** as an upgrade.
- The player activates the magnetic field.
- Nearby enemies are pulled toward the player.
- Enemies inside the field take continuous burn damage.
- After a few seconds, the field disappears.
- The player can continue normal movement and auto-attacks.

The player needs to decide **when to use the magnet.**

3.Detailed Section — The Magnetic Moment

When a large group of enemies surrounds the player, the player activates the Magnetic Attack. The field appears around the player and starts pulling nearby enemies together. Once the enemies are grouped, the field burns them and deals continuous damage.

The main decision is:

Use the magnet now to escape, or wait and pull in more enemies for a stronger attack?

This makes the feature more than just a damage upgrade. **Timing and positioning** become important.

4. Wireframes / Screen Mockups

BEFORE

"I need to avoid them"

AFTER

When the **MAGNET ATTACK** ACTIVATES

"Come closer and destroy them!"

I used the chatgpt, AI Usage & Differentiation

I used AI as a support tool during the test, mainly for organizing my ideas, improving the wording, and creating/iterating visual mockups.
